

Normal Distribution

Height Comparison

Height Comparison

It is relatively rare to see someone who is super short

Height Comparison

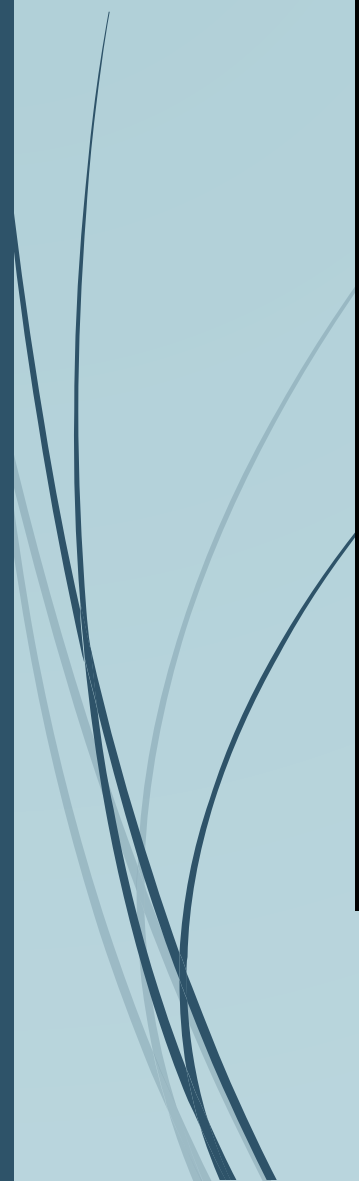

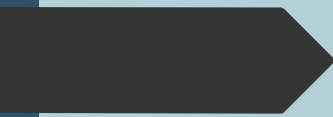

And it is relatively rare to see someone who is super tall also..

Height Comparison

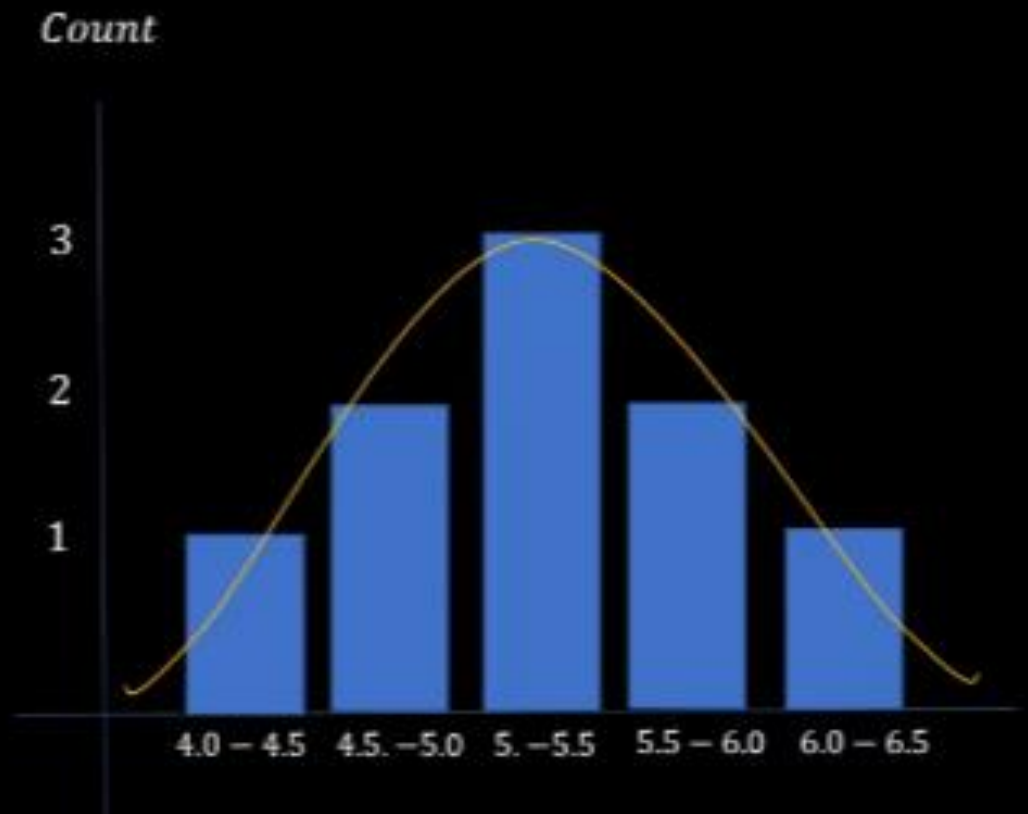

But, it is common to see someone with average heights...

Name	Height (ft)
Rob	6.2
Thomas	5.7
Nina	4.6
Mittal	5.4
Sofia	5.9
Mohan	4.3
Tao	5.1
Deepika	5.2
Rafiq	4.9

Name	Height (ft)
Rob	6.2
Thomas	5.7
Nina	4.6
Mittal	5.4
Sofia	5.9
Mohan	4.3
Tao	5.1
Deepika	5.2
Rafiq	4.9

Height Comparison

The y-axis represents the relative probability of observing someone who is really short, or really tall, or who has an average height.

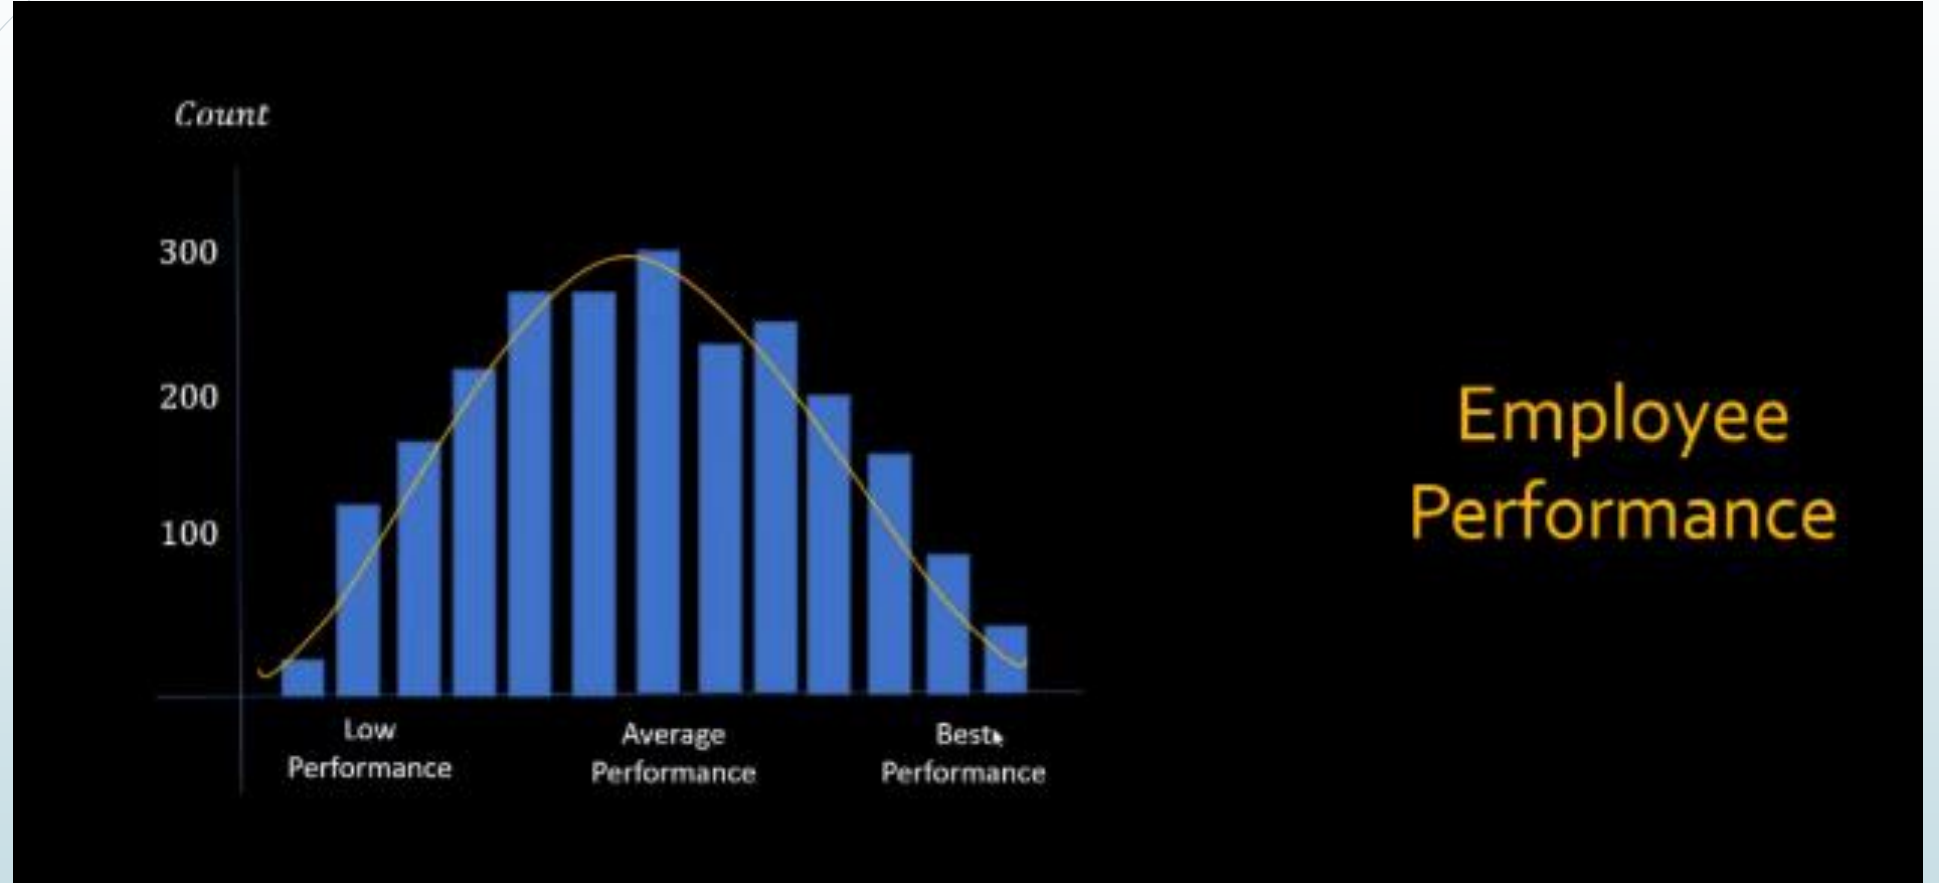

Normal distribution

A normal distribution is a type of continuous probability distribution in which most data points cluster toward the middle of the range, while the rest taper off symmetrically toward either extreme.

Examples:

Employee
Performance

What Is a Bell Curve?

What Is a Bell Curve?

The normal distribution is often referred to as a '**bell curve**' because of its shape.

A bell curve is the graph that depicts a normal probability distribution.

A bell curve is the graph that depicts a normal probability distribution.

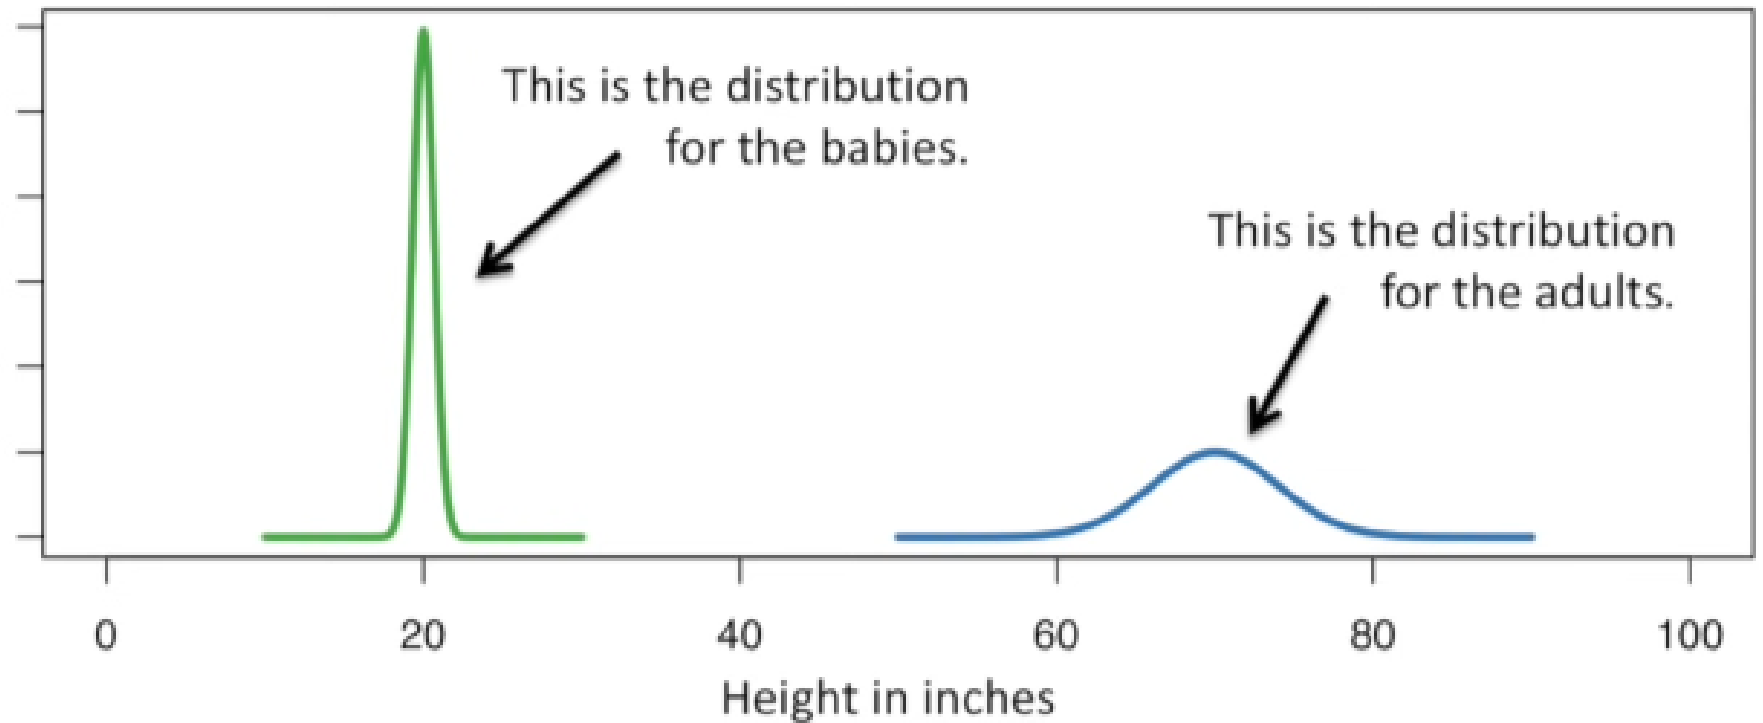

- The bell curve is perfectly symmetrical.
- It is concentrated around the peak and decreases on either side.
- In a bell curve, the peak represents the most probable event in the dataset while the other events are equally distributed around the peak.

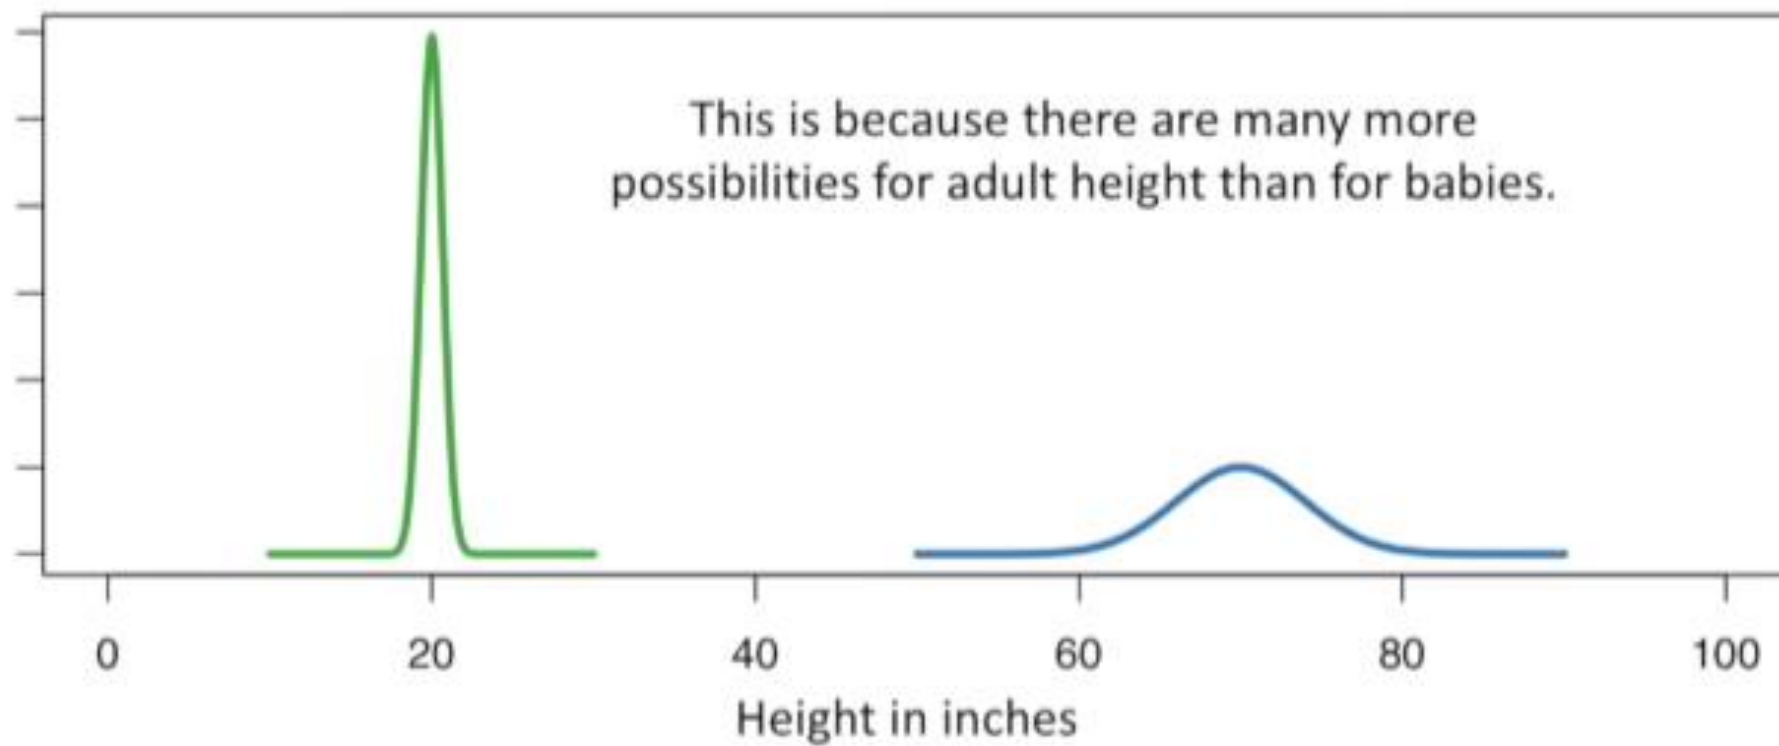

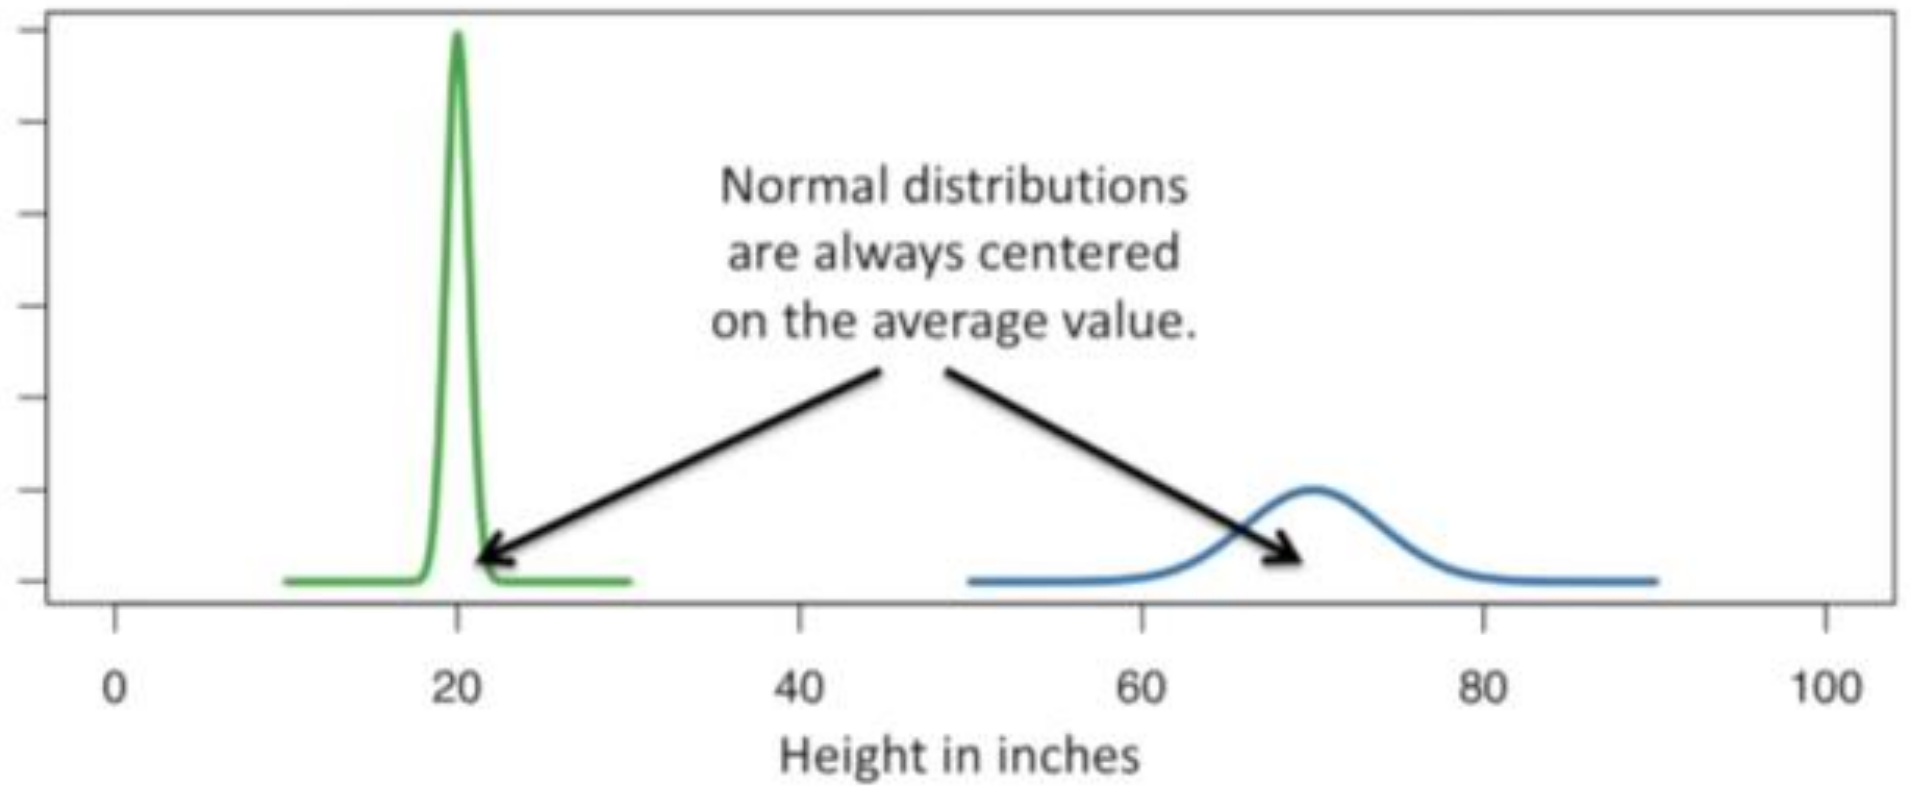

Central Tendency of Data

Comparing two Distributions:

Mean, Median, and Mode: In a normal distribution, the mean, median, and mode are all equal and located at the centre of the distribution.

❓ **Symmetry:** The normal distribution is symmetric around its mean. This means the left side of the distribution mirrors the right side.

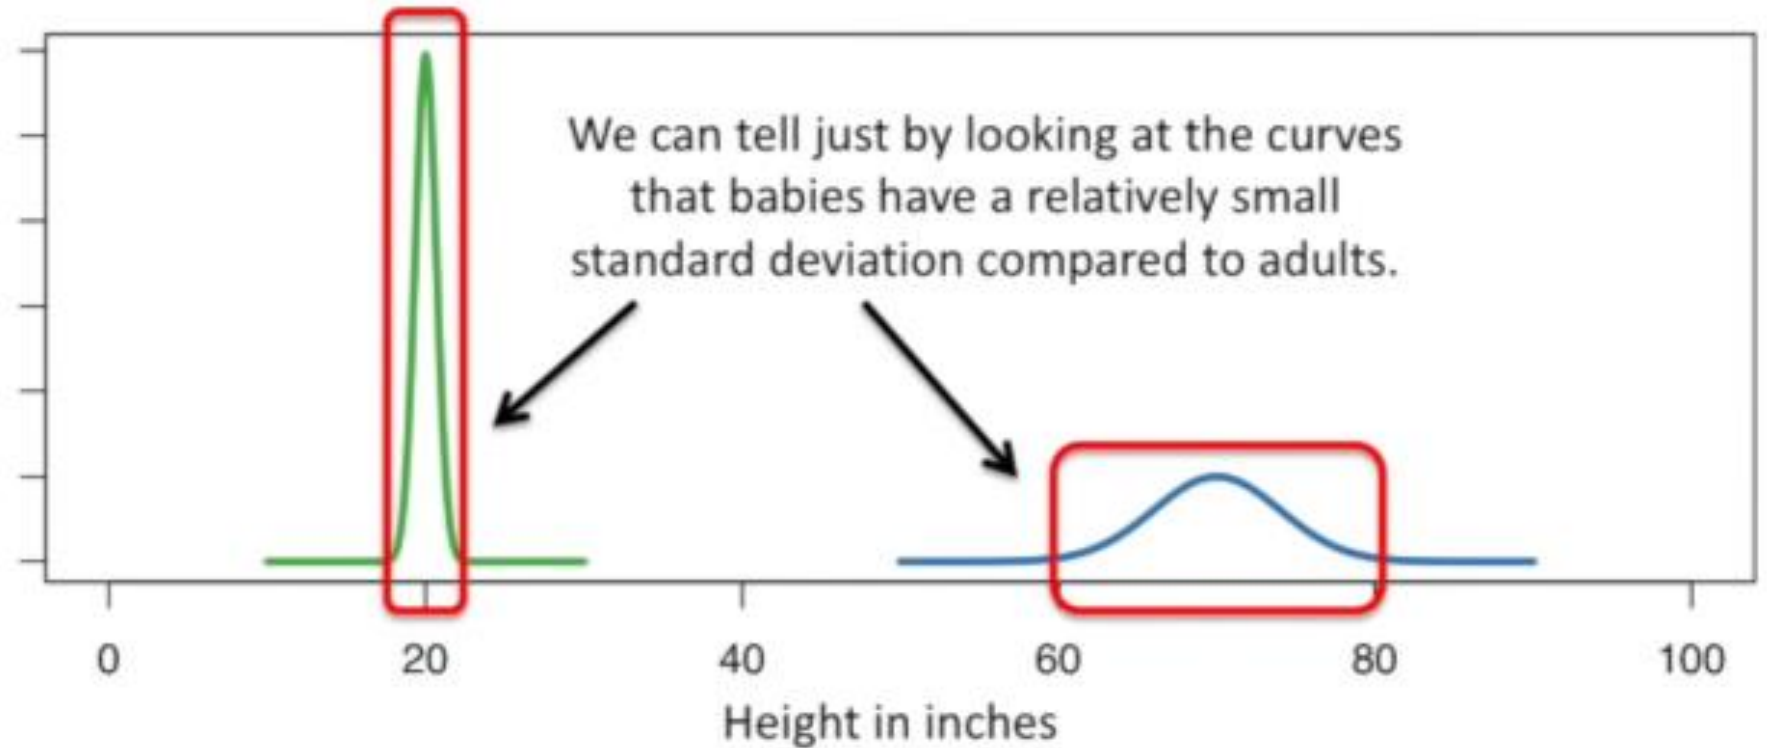

If we change the value of the mean, then the curve of normal distribution moves either to the left or right along the X-axis.

Spread of Data

Standard deviation (σ) measures how far a 'typical' observation is from the average of the data (μ).

The standard deviation defines the width of the graph.

Normal distributions with the same mean but different standard deviations.

Income in rural and urban areas:

The individual income in rural areas does not vary by much, hence we see less deviation from the average

The individual income in urban areas varies due to uneven wealth distribution, hence deviation is more spread out

Empirical rule

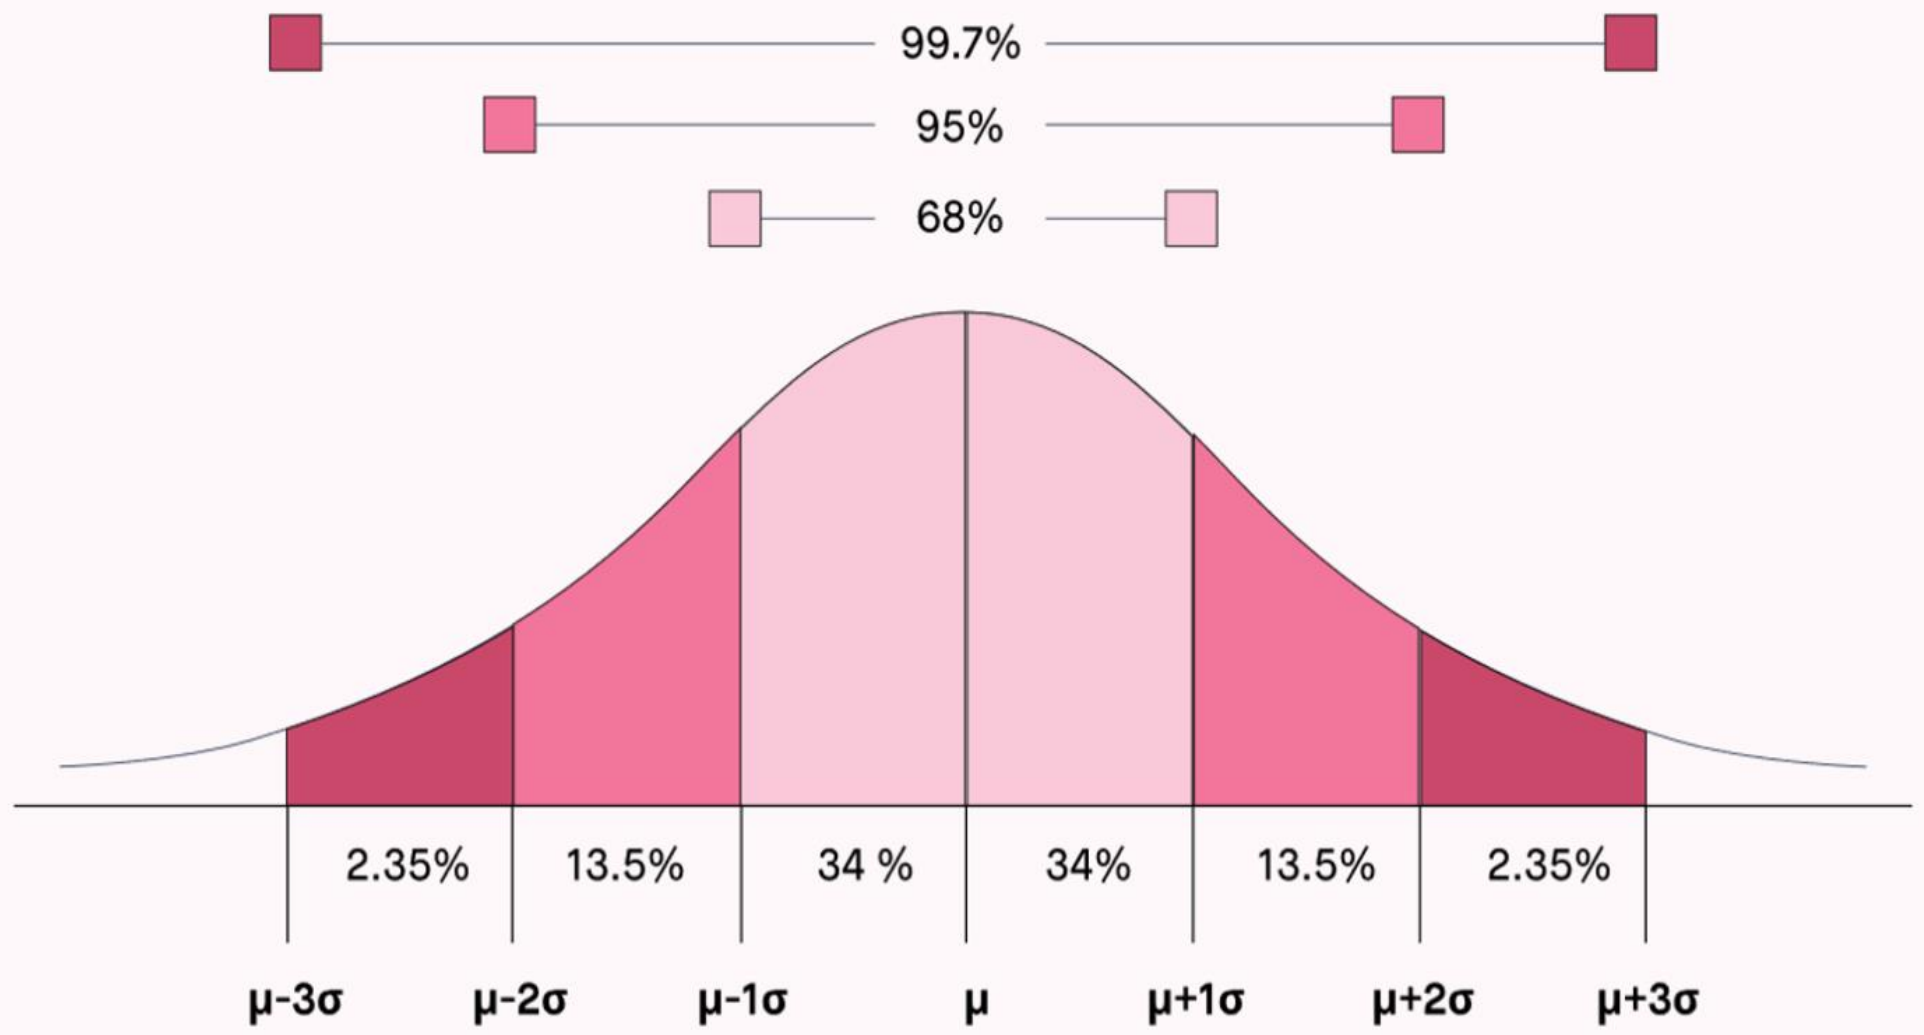

Empirical rule

An empirical rule in statistics states almost all of the observations in a normal distribution lie within three standard deviations from the mean.

Empirical rule

- ❑ 68% of the observations will lie within $(\pm) 1$ standard deviation from the mean
- ❑ 95% of the observations will lie within $(\pm) 2$ standard deviations from the mean
- ❑ 99.7% of the observations will lie within $(\pm) 3$ standard deviations from the mean

Area under the curve

Area under the curve

- ❑ The area under the curve of the normal distribution represents probabilities for the data.
- ❑ The area under the whole curve is equal to 1, or 100%

How different the distribution is from a normal distribution?

Hospitalization Days

Skewness

- ❑ **Skewness** is a measure of the asymmetry of a distribution.
- ❑ A normal distribution has a skewness of zero, which means it is symmetric and balanced.
- ❑ In a distribution with zero skew, the mean and median are equal.

Skewness

(a) Negatively skewed

Negative direction

(b) Normal (no skew)

The normal curve represents a perfectly symmetrical distribution

(c) Positively skewed

Positive direction

Skewness

Right skew (positive skew)

- ❑ Longer on the right side of its peak than on its left.
- ❑ Has a long tail on its right side.
- ❑ Right skew:
 $\text{mean} > \text{median}$

Left skew (negative skew)

- ❑ Longer on the left side of its peak than on its right.
- ❑ Has a long tail on its left side.
- ❑ Left skew:
 $\text{mean} < \text{median}$

The normal Distribution is kind of magical in that we see it a lot in nature.

That makes it super useful for statistics and data science as well.
